

## Language Summary

This appendix describes the **vcc** command and the VAX C/ULTRIX language features.

### D.1 The vcc Command

The **vcc** command is an ULTRIX command that compiles one or more VAX C source files into one or more object files. The source file or files compiled into an object module is called the compilation unit.

The **vcc** command has the following form:

```
vcc [-options [args]]... filename[.type] [...filename[.type] ] [-options [args]]
```

#### vcc Command Options:

| Option             | Description  |
|--------------------|--|
| <b>-B string</b>   | Finds a substitute compiler, preprocessor, an assembler, and a linker in the files named by string. If string is empty, use a standard backup version.   |
| <b>-b</b>          | Does not pass the library file <b>-lc</b> to the linker. This is a linker option.  |
| <b>-c</b>          | Generates an object file with a .o file extension. The linked, executable module is not generated.   |
| <b>-D name=def</b> | Assigns the specified value ( <i>def</i> ) to <i>name</i> . The preprocessor interprets this option. If a definition value is not specified, the name is set equal to 1.   |
| <b>-E</b>          | Runs the vcc preprocessor. The code is preprocessed, and all preprocessor directives, such as include file statements, are resolved.   |
| <b>-Em</b>         | Runs the cpp preprocessor and produces the makefile dependencies.  |
| <b>-f</b>          | Enables single-precision, floating-point arithmetic. Double-precision, floating point is the default selection. Procedure arguments are still promoted to double-precision, floating-point format.   |
| <b>-g</b>          | Generates additional symbol table information for the dbx debugger.  |
| <b>-Idir</b>       | Specifies the name of the directory containing the relevant include files. A search for included files whose names do not include a directory specification, occurs in: the directory of the file, the directory named by the <b>-I</b> option, and finally in directories contained in a standard list. |
| <b>-K</b>          | Generates a full MAP table. This is a linker option. It may be specified on the <b>vcc</b> command line or the linker command line.  |

| Option                  | Description   |
|-------------------------|---|
| <b>-l<math>x</math></b> | Specifies a library to include in the link process. The variable $x$ is an abbreviation for the library and path name <code>/lib/lib<math>x</math>.a</code> in which $x$ is a string. If the library is not found, the linker searches for <code>/usr/local/lib/lib<math>x</math>.a</code> . A library search starts when the library name is encountered. As a result, the placement of the <b>-l</b> within the <b>vcc</b> or linker command line is significant.                                 |
| <b>-Md</b>              | Specifies the double-precision, floating-point type as <code>D_floating</code> . This is the default selection. The linker also receives the <b>-lc</b> flag.   |
| <b>-Mg</b>              | Specifies the double-precision, floating-point type as <code>G_floating</code> . The linker also receives the <b>-lg</b> flag. If you want to use the math library, with code generated with the <b>-Mg</b> option, you must link in the <code>G_FLOAT</code> version of the library by specifying <b>-lmg</b> on the linker or <b>vcc</b> command line.  |
| <b>-o</b>               | Accepts the specified name as the final output file name. This is a linker option. It may be specified on the <b>vcc</b> or linker command line.  |
| <b>-O</b>               | Invokes the object code improver. The default selection is to perform object code optimization.   |
| <b>-p, -pg</b>          | Prepares object files for profiling. The <b>-pg</b> option also invokes a run-time recording mechanism that produces a <code>gmon.out</code> file. This file contains more extensive statistics.  |
| <b>-t [0pal]</b>        | Finds only the designated compiler, preprocessor, assembler, and linker in the files whose names are constructed by a <b>-B</b> option. In the absence of a <b>-B</b> option, these are found in the standard places.   |
| <b>-Uname</b>           | Makes the specified variable undefined within the program. This option is interpreted by the preprocessor.  |
| <b>-v filename.lis</b>  | Produces the listing file, complete with a cross-reference table and machine code listing.  |
| <b>-V option</b>        | Compiles the source code using vendor-specific options.   |
| <b>-w</b>               | Suppresses compiler warning messages. Error messages are displayed, but warning messages are not.   |
| <b>-Y [option]</b>      | Compiles a file for one of the following options: <code>SYSTEM_FIVE</code> , <code>BSD</code> , or <code>POSIX</code> . If a parameter other than <code>SYSTEM_FIVE</code> , <code>BSD</code> , or <code>POSIX</code> is specified, a warning is printed and the <b>-Y</b> option is ignored. If no parameter is specified, <b>-Y</b> defaults to <code>-YSYSTEM_FIVE</code> . If multiple <b>-Y</b> options are specified, only the last option takes effect, and no warning message is generated. |

## D.2 Data-Type Keywords

### Type Specifiers:

32-bit signed or unsigned:

```
int
long
long int
unsigned int
unsigned long
unsigned long int
```

16-bit signed or unsigned:

**short**  
**short int**  
**unsigned short**  
**unsigned short int**

8-bit signed or unsigned:

**char**  
**unsigned char**

F\_floating format:

**float**

D\_floating or G\_floating format:

**double**  
**long float**

Aggregate types:

**struct**  
**union**  
**variant\_struct**  
**variant\_union**

Enumerated type:

**enum**

Type of function return value:

**void**

Type declaration:

**typedef**

Storage-class specifiers:

**auto**  
**register**  
**static**  
**extern**  
**globaldef**  
**globalref**  
**globalvalue**

Data-type modifiers:

**const**  
**volatile**

Storage-class modifiers:

**readonly**  
**noshare**  
**\_align**

---

## D.3 Precedence of Operators

In the following table, the operators are listed from highest precedence to lowest. In the binary operator category, operators appearing on higher lines within the category have a higher precedence than the other binary operators.

| Category    | Association   | Operator                        |
|-------------|---------------|---------------------------------|
| Primary     | Left to right | ( ) [ ] -> .                    |
| Unary       | Right to left | ! ~ ++ - (type) - * &<br>sizeof |
| Binary      | Left to right | * / %                           |
|             |               | + -                             |
|             |               | << >>                           |
|             |               | < <= > >=                       |
|             |               | == !=                           |
|             |               | &<br>^<br> <br>&&<br>           |
| Conditional | Right to left | ?:                              |
| Assignment  | Right to left | = += -= *= /= %= > >=           |
|             |               | < <= &= ^=  =                   |
| Comma       | Left to right | ,                               |

---

---

## D.4 Statements

### Syntax:

```
[expression] ;  
identifier : statement  
{ [declaration-list] [statement-list] }  
case [constant-expression | default] : statement-list  
if (expression) statement [else statement]  
while (expression) statement  
do statement while (expression)  
for ([expression] ; [expression] ; [expression])  
statement  
switch (expression) statement  
break ;  
continue ;  
return [expression] ;  
goto identifier ;
```

---

## D.5 Conversion Rules

### Arithmetic Conversion

Any operand of type:

Is converted to:

**char**  
**short**  
**unsigned char**  
**unsigned short**  
**float**

**int**  
**int**  
**unsigned int**  
**unsigned int**  
**double**

If operand type is:

**double**  
**unsigned**

The result and the other operands are:

**double**  
**unsigned**

Otherwise, both operands are:

**int**

And the result is:

**int**

### Function Argument Conversion without Prototypes

Any argument of type:

**float**  
**char**  
**short**  
**unsigned char**  
**unsigned short**

Is converted to type:

**double**  
**int**  
**int**  
**unsigned int**  
**unsigned int**

array

pointer to array

function

pointer to function

---

## D.6 VAX C Escape Sequences

The following table lists the VAX C escape sequences:

| Character       | Mnemonic | Escape Sequence |
|-----------------|----------|-----------------|
| newline         | NL       | \n              |
| horizontal tab  | HT       | \t              |
| vertical tab    | VT       | \v              |
| backspace       | BS       | \b              |
| carriage return | CR       | \r              |
| form feed       | FF       | \f              |
| backslash       | \        | \\              |
| apostrophe      | '        | \'              |
| quotes          | "        | \"              |
| bit pattern     | ddd      | \ddd or \xddd   |

Use the form "\ddd" to specify any byte value (usually an ASCII code), where the digits ddd are one to three octal digits. The octal digits are limited to 0 to 7.

---

## D.7 Preprocessor Directives

**Syntax:**

**#define** *identifier*[[*param1*, ... *param2*]] *token-string*  
**#undef** *identifier*  
**#elif** *constant-expression*  
**#include** <*file-path*>

**#include** *"file-path"*  
**#if** *constant-expression*  
**#ifdef** *identifier*  
**#ifndef** *identifier*  
**#else**  
**#endif**  
**#[line]** *constant string*  
**#[line]** *constant identifier*  
**#pragma** *[no]builtins*  
**#pragma** *[no]inline*  
**#pragma** *[no]member\_alignment*  
**#pragma** *[no]standard*
